举个🌰

```javascript
export default nf(
  '$section$',
  whenPropSatisfies('listModules', isSectionModule, _.over(
    lensProps(['listModules']),
    _.pipe(
      as('sectionDataState', createState([])),
      _.tap(_.converge(fetchSections, [
        _.pipe(_.prop('listModules'), _.filter(isSectionModule),
_.filter(hasConfigUrl)),
        _.path(['sectionDataState', 'set'])
      ])),
      _.converge(_.reduce(_.pipe(
        _.zipObj(['listModules', 'section']),
        insertSectionModules
      )), [
        _.prop('listModules'),
        _.path(['sectionDataState', 'value'])
      ]),
      _.objOf('listModules')
    )
  ))
);
```

函数式编程中如何实现循环?
